

QUICK STUDY ON ROYAL RIFE

In searching to understand Royal Rife and his machine I came across an on-line book by Elwood Babbitt (an internationally known psychic & full-trance medium) called "Perfect Health: Accept No Substitutes". It is an on-line book that SHOULD NOT BE READ!

It celebrates Dr. Rife and his findings. But in reading the "Summary on Dr. Rife" and then realizing what I had actually started reading, I had to step back.

I quickly realized what I was actually reading was dangerous to even flirt with, even if to try to gain an understanding about Rife. Accept what I am quoting below from the book; it is enough to base a decision on to avoid this machine. I am only going to mention a few key things as I do not want to spend any more time in this than needed!

After reading some excerpts about Rife in the book and being shocked by what I was reading, I backed up to the "Editor's notes" to try and grasp where the book was coming from. In reading them, I came to the understanding that the book itself was written by a man who went into a trance and then let entities possess him and speak/write through him to create this book. Their sessions were recorded and later transcribed. He took on the spirit of the people mentioned in the book, then (through trance) they told him "more" about those people and their life, so that this important info could be communicated to all of us. "No, I don't want to have any part in believing a shred of what they are teaching!"

Let me restate the origin of this book with a direct quote from the editor's notes:

"The transcriptions (in this book) reflect the actual words spoken by the entities."The book "has spirit authors".

That's who wrote it, completely; evil spirits masquerading as the person himself...to share more information that people (now-present day) need to know.

The people the book talks about include:

- Dr. James Porter Mills
- Dr. Royal Rife
- Dr. Seymore Weiss & his relationship with Edgar Cayce
- Dr. Wilhem Reich
- Dr. Foote

● Edgar Cayce

It should also be mentioned that two things were clearly stated at the beginning of the book:

1. "the principle idea (held within this book) shall be that man holds within himself the spark of godliness."
2. "man has the power to have dominion over his body and to choose health or disease".

In essence, this is classic spiritualism. Yet, it is also important to realize that any healing method which gives you "dominion over your body for healing", is not God's way! These are the ways evil spirits are advocating and teaching. This is what Rife did, this is what CST does, and many other healing techniques that involve "energy". Rife focused on the aura/chakra energy surrounding the cell and it's vibration. This is explained below by the entity who supplied the chapter on Rife.

The spirit of Dr. Rife states:

"Through the spiritual gift of clairvoyant vision...Dr. Royal Rife...was able to study the aura of the cell...which led to his development of the Rife machine. The aura of the cell is the complete color spectrum...also known as the energy of the body...seen as color swirls...called chakras."

(Next, I'm going to take pieces from the book and pare them down to the most important points. Here's what is said:)

Dr. Rife had the ability to use clairvoyance or the visionary force of life indoctrinated in him when he was a child. He went on as an adult to study medicine only for the purpose of trying to find cures for cancer and terminal illnesses because he wanted to "further the meaning and understanding of life beyond the normal and scientific approaches". He wanted to give humanity more "self-realization". "He found his clairvoyance could see beyond that which the microscope could see". He began to see "with his inner vision" "the specific force of all creation, which is vibration". He proceeded to change the vibratory rate, which led to the development of his machine.

Honestly, I cannot and will not read much of this book as it is coming straight from an evil spirit. It states "I am Dr. Rife speaking to you. I have been asked by a messenger from the supreme forces of infinitude, to give a reinforcement of the harmonization in regards to the specifics of the body cell." (That's enough. I don't need to read more!)

Get involved with Rife and you are getting involved with a machine that a messenger from Satan himself was sent to reinforce. Those are "HIS" words, not mine! He clearly states who he is and why he came via trance to talk about Dr. Rife, his work, and the principles behind it. Quantum physics, cells having thought and memory...auras...vibrations...frequencies...unseen "energy" that can be used, harnessed, or guided in some way to achieve healing...these are all in the realm of pseudoscience that Satan is bombarding us with in the present day. In the end, it all winds up having YOU take some kind of control in healing your body. It is not a reliance on God and His strength, HIS simple 7 Laws of Health, and His simple remedies, but a reliance on "advanced knowledge" beyond what most people understand and know about. It caters to a form of "self-realization" just like what the entity said.

Here are some intelligent FORUM discussions people wrote about RIFE, speaking on a more medical/scientific basis:

As for the Rife machine, any device that will kill a cancer cell, bacteria, virus, or any other living matter via EMF will kill a healthy cell as well. Not sure where you get the notion that EMF will only discriminate living matter we humans deem to be pests and not our own healthy cells. EMF is merely energy. It has no ability to destroy a bacteria just on the basis of it being infectious to humans.

The term "frequency" apparently has magical connotations for some people. I can say that light has a certain frequency, or that a microwave oven cooks with radiation of a certain frequency (or band of frequencies, actually, not just "one" discrete frequency), and so on. Most of us don't understand light or electromagnetic radiation at all, although we talk about it, and we can measure it and make devices that generate it. In our minds, it's easier for us to understand sound, and that's where most of us get our understandings of "frequencies" and waves. We understand sound frequencies more easily, although sound is a mechanical wave, but we can say the same thing about sound: it has a certain frequency or frequencies. A particular piano key will play middle C.

We can measure these frequencies, such as in the case of something that is emitting electromagnetic radiation or sound. Measuring a frequency or frequencies that something emits is one thing, but to measure what something absorbs is a little bit more difficult sometimes. Scientists, being curious by nature, have actually measured the absorption spectra of living cells, beginning many decades ago, and what's fascinating is that the art has

progressed to the point of being able to track biochemical transformations within a living cell, such as where carotenoids are distributed (see, for instance, <http://www.plosone.org/article/info%3Adoi%2F10.1371%2Fjournal.pone.0024302>.) Those who pontificate that microorganisms (or even cancer cells) have their own "frequencies" don't get more specific than the amorphous term "frequency," so I don't know what they mean by that generally, and I know that they don't. Since a blue shirt will absorb light except for blue, which it reflects, if someone wants to know what the "frequency" is of that blue shirt, do they mean what it absorbs, what it reflects, or what?

Infrared radiation is composed of a wide spectrum of frequencies, and if we stand next to something emitting IR, we're going to get warm, and you can't describe us as having any one frequency or another.

Similarly, if you put a coffee cup and saucer on top of a bass speaker, you'll discover that there is no "the" frequency that makes the coffee cup shake on its saucer, although experimentation might reveal that it shakes more at certain frequencies (i.e., that some kind of resonance exists.)

To look at a bacterium or fungus and say that it "has" some kind of "frequency" is puzzling to me. We have all manner of instruments in the laboratory that can measure what objects or substances can absorb or reflect, electromagnetically, as well as what they emit.

I'd like to know how on earth are you going to say that a particular organism, let's say a batch of *Clostridium botulinum* growing in your test tube, "has" some kind of "frequency." Exactly what do you mean by that? How do you "know" if you start treating your test tube with various frequencies of radiation, whether microwave, radio, visual, or any of it, or of sound, which, let us remember is not part of the electromagnetic spectrum, that any one particular frequency is "the frequency" of that organism? I don't even see them specifying what kind of "frequency" they mean, just "frequency." "What's the frequency, Kenneth?"

Those who are familiar with science fiction will be familiar with the concept of a death ray. As described, the Rife machine is nothing but a fancy death ray machine with a dial that you turn to different positions depending on what you're trying to kill. The implicit assumption being made by these people here is that every single organism can be identified by a particular, unique frequency of radiation that will kill it, and it alone, so that, even when mixed among millions of bodily cells, a particular pathogen will up and die when the body it's in is treated with that particular frequency.

This is a testable proposition. You could mix up some e. coli and some c. botulinum in a test tube, and treat that mix with various frequencies of radiation, so that eventually you would be able to say, oh yes, frequency X will kill the e. coli, and frequency Y will kill c. botulinum.

It is true that some radiation is lethal to everything, and that some species are more sensitive to some than to others. A bacterium that thrives near a volcanic vent would probably be much less sensitive to IR radiation than one than the mold you just found growing in the cheese that had been hiding in the back of your fridge for several months.

But to assert, not only that such particular wavelengths--"the" frequencies--exist, but that you can, magically apparently, apply those particular frequencies to a human organism and have those "the" frequencies manifest themselves throughout an entire human organism so as to kill only a particular pathogen, while being totally inert to healthy cells, strikes me as a rather strange hypothesis. If all the organisms that you're trying to kill are in one place, then that's exactly what radiation therapy to treat cancer does: it kills only a particular set of cells, because the radiation only reaches the abnormal cells at which it is aimed (not really "only" the cancer cells, but mostly, since they can't be 100% perfect in their aim.) And thermal therapy--the use of heat to kill invading organisms--is something that your body already uses; it's called a fever, but it is not harmless to normal cells, since people can die from it. One form of radiation therapy, total body irradiation (TBI) uses the same principle: but it's not harmless to normal cells either.
